

Felton's MultiFlex™ ...

MultiFlex™ Nomenclature

MultiFlex™ is generally used as a flexible sight seal or splashguard where the mounting surface is irregular such as being curved or wavy. MultiFlex™ begins with a ribbon of fill material that can be attached in several ways to various materials to form the final brush.

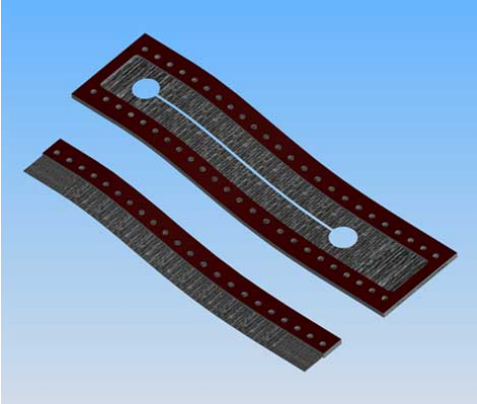

Sonic Weld to Plastic Carrier

Ribbon is placed onto a thin, premade, die-cut or molded plastic part and sonic welded in place.

Insert in Flexible or Rigid Plastic

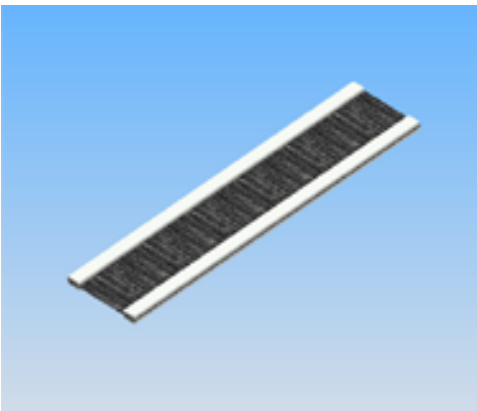

Ribbon is inserted in an injection mold and the plastic is injected around the ribbon. Molding material can be made very stiff or flexible as desired.

Co-Molded with Sarlink and Rigid Plastic

The plastic can be two durometers co-molded to the desired shape, with the ribbon sonic-welded in place.

Double-Sided Tape

Ribbons can have double-sided tape applied to one or both sides as a fastening method.
